Intensive Care Resources and Activity Report 2017/18

Australia and New Zealand Intensive Care Resources & Activity Report 2017/18

Acknowledgements

The Australian and New Zealand Intensive Care Society (ANZICS) Centre for Outcome and Resource Evaluation (CORE) greatly appreciates patients, their carers and the efforts of the intensive care community in Australia and New Zealand, without their contributions this data resource would not be possible.

Thanks are extended to the ANZICS CORE Management Committee and the ANZICS Safety and Quality Committee for their input into survey design.

List of Figures

List of Tables

Executive Summary: Critical Care Resources & Activity

The 2017/18 CCR survey was completed by 170 Intensive Care Units (ICUs) in Australia and New Zealand. The report includes all contributing ICUs and high dependency units (HDU) managed by the intensive care team. This represents 78% of the 217 open ICUs, 82% of public ICUs and 71% of private ICUs. Bed analysis includes data from all Australian and New Zealand ICUs, whilst activity data only includes ICUs that contributed to the survey. Reported changes over 2 or 5 years are based on consistently contributing ICUs.

Changes in Critical Care Resources & Activity

- 0.9% growth in available beds
- 1% increase in admissions
- 2.6% decrease in patient days
- Of the 170 ICUs, 25 expect to increase available beds in 2018
- Staffing kept pace with activity changes.

Admissions & Patient Days

- 214,760 admissions were reported from 200 ICUs
- 527,253 patient days were reported from 156 ICUs with a 11.5% decrease in private ICUs, compared to a 1% decrease in public ICUs
- Metropolitan ICUs had a 0.3% increase in patient days, whilst private, tertiary and rural ICUs had a decrease of 11.5%, 1.4% and 0.3% respectively.

Availability of ICU Beds

2,482 available beds (n=207) and 2,985 physical beds (n=209) across contributing ICUs, with a 0.9% increase in available beds (n=204) and 1.8% increase in physical beds (n=206).

New Beds to be Built or Opened in 2019 FY

- 25 ICUs reported planning to build new physical beds, an expected net gain of 118 physical beds.
- 25 ICUs plan to open new available beds, a net gain of 117 available beds.
- Of the 117 available beds expected to open, 63 beds will open in tertiary ICUs.

Regional Change in Available Beds

Regions with an increase in available beds:

- NSW 9 beds (1%)
- SA 1 bed (0.6%)
- VIC 10 beds (2.2%)
- WA 8 beds (4.8%)
- NZ 1 bed (0.4%)

QLD had a decrease of 7 beds (1.7%)

ACT, NT and TAS had no change in available beds.

Ventilation

In 2017/18, the proportion of ventilated patients was 35.4%, down from 36.0% in 2017. The proportion of patients receiving invasive ventilation continues to decline.

Health Service Changes

New Hospital ICU/HDU/PICUs Opened

- Calvary Bruce Private HDU (ACT, Private)
- John Hunter Children's Hospital PICU (NSW, Tertiary)
- Monash Children's Hospital PICU (VIC, Tertiary)
- Perth Children's Hospital PICU (WA, Tertiary)
- St John of God Berwick ICU (VIC, Private)
- Sunshine Coast University Hospital PICU (QLD, Tertiary)
- The Bays Hospital ICU (VIC, Private).

Hospital ICU/HDU/PICUs Closed

- Geelong Private Hospital ICU (VIC, Private)
- Repatriation General Hospital Adelaide ICU (SA, Metropolitan)
- Princess Margaret Hospital for Children PICU (WA, Tertiary) – transitioned to Perth Children's Hospital PICU.

Executive Summary: Critical Care Resources & Activity

Workforce

Senior Medical Workforce

152 ICUs (89%) reported Senior Medical Officer (SMO) data for 2017/18 with a total of 783.1 full time equivalent (FTE).

- 120 ICUs (81.1%) reported intensivists work between 4-7 consecutive days (range 1-8)
- 119 ICUs (70%) reported having practicing female intensivists (n=257) with a total of 160.1 FTE (20.4%)
- 3.1% increase in SMO FTE (n=129)
- 2.7% increase in SMO FTE in public ICUs (n=99)
- 5.8% increase in SMO FTE in private ICUs (n=30).

The SMO Established FTE per 1000 patient days has remained consistent at 1.5 FTE, with admission numbers increasing by 1.0% despite the reported 2.6% decrease in patient days for 2017/18.

Nursing Workforce

164 ICUs reported permanent registered nurse (RN) data for 2017/18 with a total 98226.1 FTE.

- 3.3% increase in permanent RN FTE (n=143)
- 3.5% increase in public ICUs (n=108)
- 1.8% increase in private ICUs (n=35).

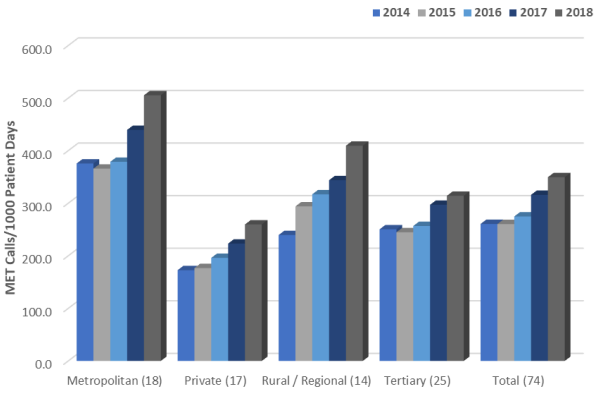
The RN Established FTE per 1000 patient days showed an increase of 1.5% despite the reported decrease in patient days.

The total vacancy rate for 2017/18 was 6.7%, slightly higher than the reported 5.5% for 2016/17.

Medical Emergency Teams

Met calls over 5 years are reported from 74 ICUs that consistently provided data for MET calls and bed days over that time. Figure 1 shows an increasing number of MET calls per 1000 patient days across all classifications over 5 years.

Figure 1 MET Calls per 1000 Patient Days over 5 years, by Classification

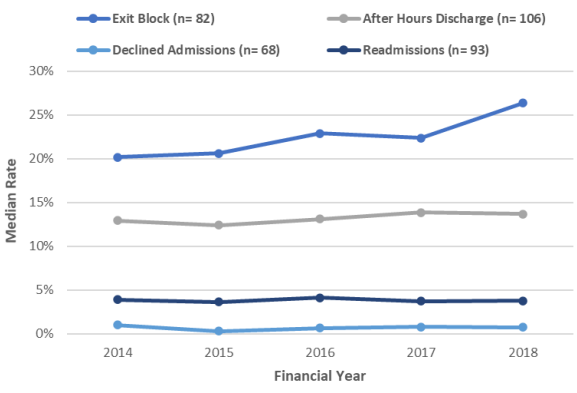


Data from 74 consistently contributing ICUs.

Readmissions, Declined Admissions, Exit Block and After Hours Discharge

Figure 2 shows the median rate of each clinical indicator over 5 years. Exit block showed an absolute increase in the median rate of 6.2%, whilst readmissions, declined admissions and after hours discharge remain relatively constant.

Figure 2 Clinical Indicators over 5 years



Consistently contributing ICUs for each clinical indicator (n= No. of ICUs).

Overview of CCR Survey

Introduction

The Critical Care Resources (CCR) Survey is one of four registries administered by the Australian and New Zealand Intensive Care Society (ANZICS) Centre for Outcome and Resource Evaluation (CORE), a not-for-profit organisation located in Melbourne, Australia. The other registries managed by ANZICS CORE are:

- The Adult Patient Database (APD) - collects data on adult admissions to ICUs,
- The Australian and New Zealand Paediatric Intensive Care (ANZPIC) Registry - collects data on ICU admissions of patients under the age of 16 years, and
- The Central Line Associated Blood Stream Infection (CLABSI) Surveillance Program - collects data on ICU CLABSI rates.

The CCR Survey has collected data on activity, resources and processes of care from Australian and New Zealand ICUs since 1993. Detail on the CCR Survey can be found at: https://www.anzics.com.au/critical-care-resources-ccr-registry/

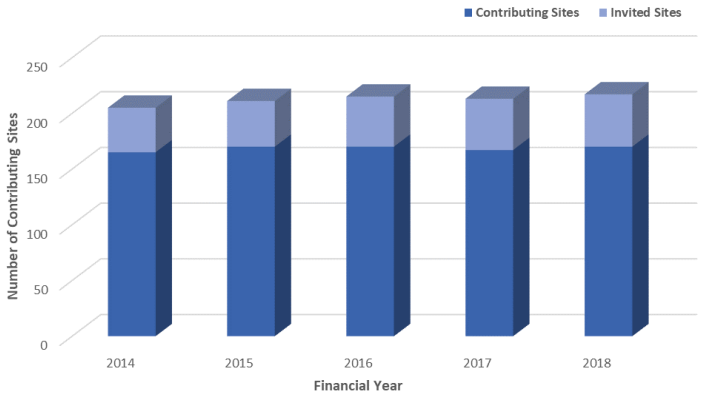
This report describes the changes in activity and bed numbers as reported in the 2017/18 CCR and comparative reporting over 5 years from ICUs who have consistently submitted data over this period. In 2017/18 there were 217 open ICUs in Australia and New Zealand. Overall, there were 2,482 available beds and 2,985 physical beds. All data included in this report were correct at the time of the survey.

Contribution to the 2017/18 CCR Survey

The 2017/18 CCR Survey had a response rate of 78% with 170/217 ICUs across Australia and New Zealand contributing to the survey.

Figure 3 shows that there has been a slight increase (5.8%) in the number of open ICUs and the response rate has remained relatively constant over the last 5 years.

Figure 3 Contribution to CCR over 5 years



For the analysis over time, only data from ICUs that consistently contributed to the survey for the years indicated were included. The number of contributing ICUs differs for each question. Where relevant the number of ICUs included in the analysis has been included with each graph throughout the report.

Unless otherwise indicated, standalone PICUs are included in the presented data.

Intensive Care Bed Stock

Physical Bed

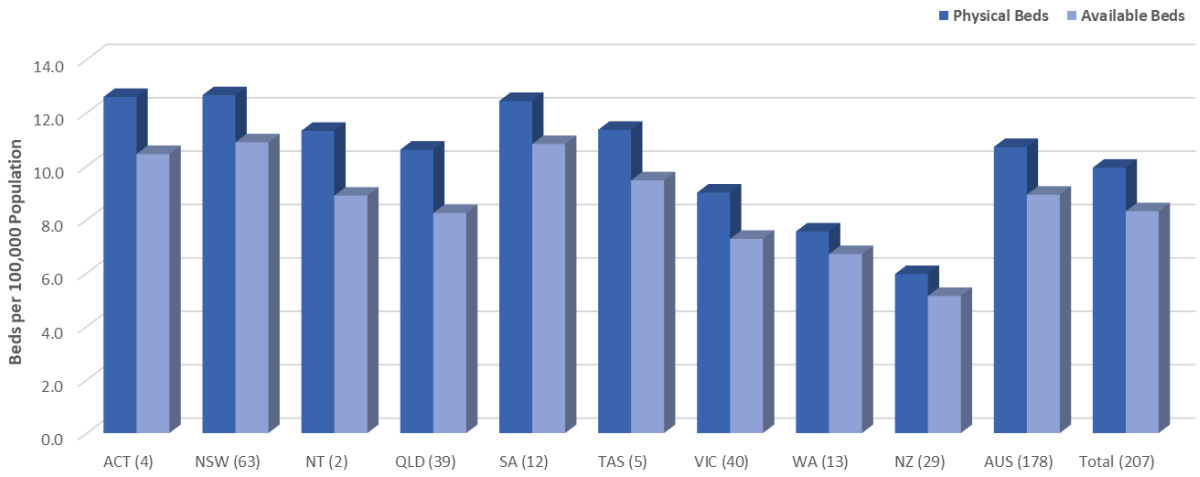
A single patient care location fully configured to ICU standards. It is an actual bed, not a bed space.

Available Bed

A bed with advanced life support capability that is fully staffed and funded.

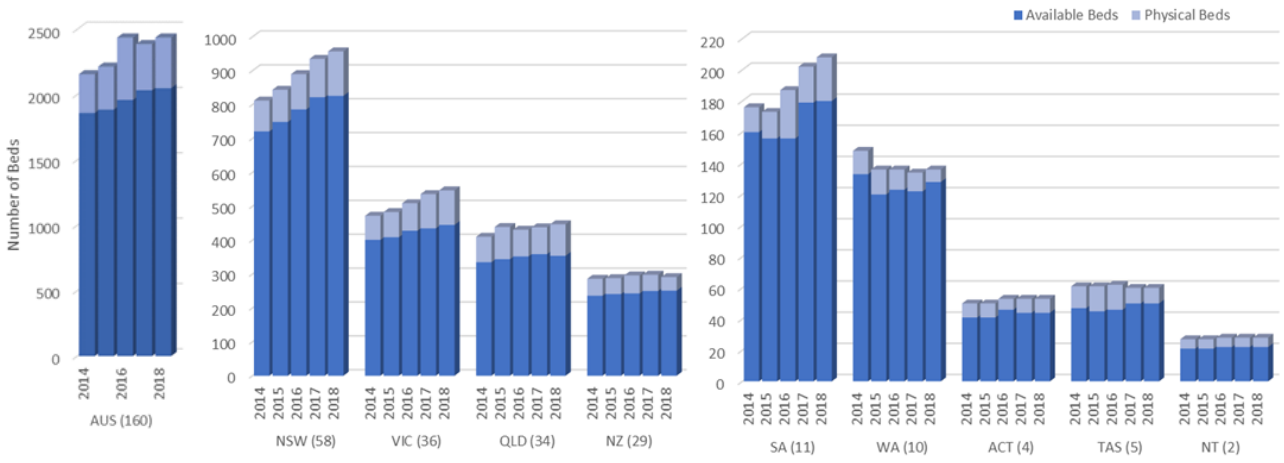
Distribution of Physical and Available ICU Beds

Figure 4 Physical and Available Beds per 100,000 Population in 2017/18, by Region



Data from ICUs that reported both available and physical beds.

Figure 5 Number of ICU Available and Physical beds over 5 years, by Region



Data from 189 consistently contributing ICUs that reported both available and physical beds.

Data from 2017/18 contributing ICUs and follow-up with non-contributors.

ICU Activity – Admissions and Discharges

Planned Admission

A planned admission to ICU/HDU. Post-surgical/procedure admissions are considered planned admissions when the need for admission was anticipated pre-operatively or prior to induction of anaesthesia. For non-surgical admissions, a planned admission should be considered as one that could be postponed for 24 hours with no adverse effect.

Unplanned Admission

An emergency admission to ICU/HDU for urgent care or treatment that could not be postponed without adverse effect. A postponed planned admission can subsequently become an unplanned or urgent admission.

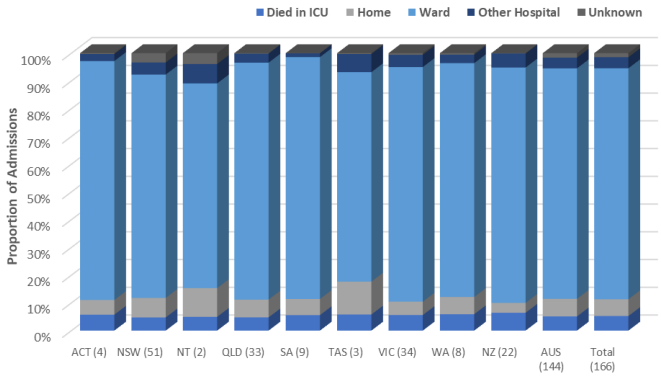
Data from 166 contributing ICUs.

Figure 12 Destination at ICU Discharge in 2017/18, by Region



Data from 166 contributing ICUs.

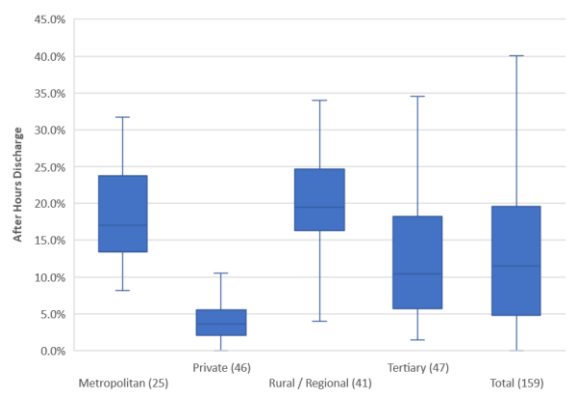
After Hours Discharge

After Hours Discharge

Discharge of a patient between 18:00 hours and 05:59 hours. Excludes patients that died in ICU or transferred to Other ICU or Other Hospital.

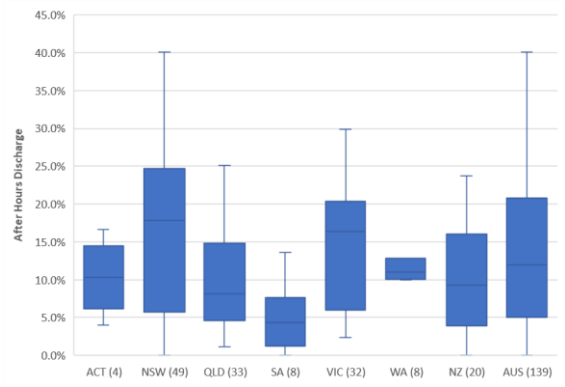
In 2017/18, 159 ICUs reported after hours discharge data showing an overall after hours discharge rate of 13.4%.

Figure 13 Median and IQR Unit After Hours Discharge Rate in 2017/18, by Classification



Data from 159 contributing ICUs.

Figure 14 Median and IQR Unit After Hours Discharge Rate in 2017/18, by Region



Data from 159 ICUs. NT (2) and TAS (3) excluded for individual reporting to avoid identification of individual ICUs.

Readmissions

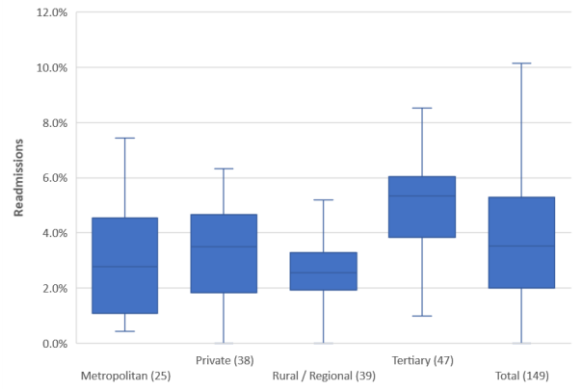
Readmission

Any second or subsequent admission to ICU/HDU within the same hospital admission, excluding direct transfers to or from ICU/HDU.

Readmission includes all readmissions; it is not equivalent to the ACHS indicator “readmissions within 72 hours”.

In 2017/18, 149 ICUs reported readmission data showing an overall patient readmission rate of 4.6%.

Figure 15 Median and IQR Unit Readmission Rate in 2017/18, by Classification



Data from 149 ICUs.

Consistently contributing ICUs. ACT (2), NT (2) and TAS (2) excluded for individual reporting to avoid identification of individual ICUs.

Trend in Declined Admissions

Declined Admissions

The CCR Survey collects two variables on declined admissions; declined elective surgery admissions due to inadequate ICU resources and declined unplanned admissions due to inadequate resources.

Declined elective surgery admissions due to inadequate resources are calculated as a proportion of planned admissions to ICU and declined unplanned admissions due to inadequate resources as a proportion of unplanned admissions to ICU. The two data point are combined to calculate an overall declined admission rate as a proportion of total ICU admissions.

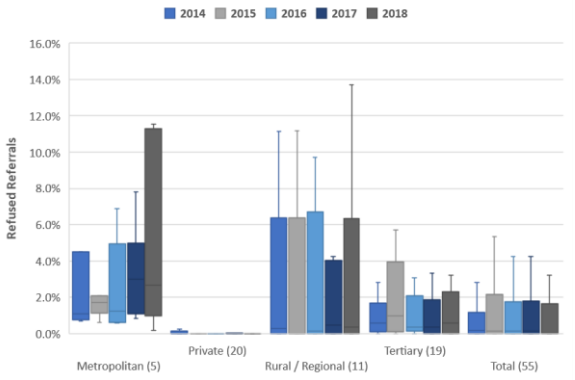
Declined Unplanned Admissions Due to Inadequate Resources

Figure 23 Median and IQR Refused Referral Rate over 5 years, by Classification



Consistently contributing ICUs.

ICU Activity – Patient Bed Days and Occupancy

Patient Bed Days

The total number of days for patients who were admitted to the ICU/HDU for an episode of care. Calculated as the difference between the ICU/HDU separation date and ICU/HDU admission date. Same day patients are allocated a length of stay of one day.

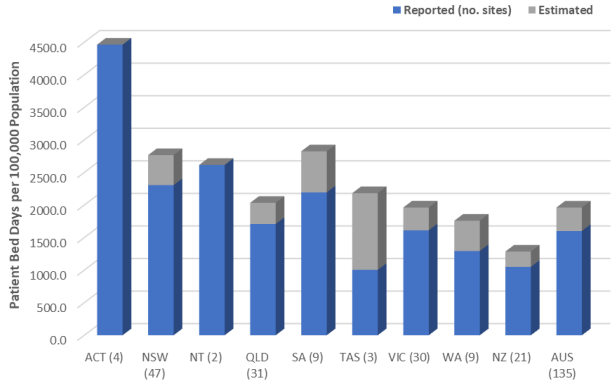
Occupancy

Calculated by dividing total bed days in a period by the product of the available beds and the days in the period.

The estimated total bed days per 100,000 population is calculated as the proportion of available beds reported.

Patient Bed Days

Figure 24 Patient Bed Days per 100,000 population in 2017/18, by Region



Data from 156 ICUs.

Occupancy

Declined Admission and Occupancy

Figure 28 Scatter Plot of Occupancy versus Declined Admissions over 5 years

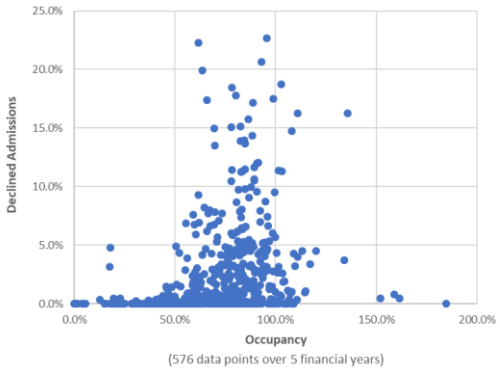

Figure 28 shows that a higher occupancy rate within a unit correlates with a higher rate of declined admissions.

Ventilation

Rates of Ventilation

Rates of ventilation are calculated as the number of ventilated patients as a proportion of all admissions.

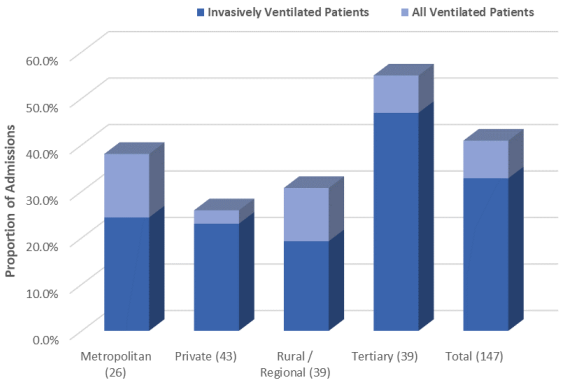
Non-Invasive Ventilation

Ventilatory support such as CPAP/BiPAP, administered via facial or nasal mask or nasal cannulae.

Invasive Ventilation

Mechanical ventilator support via oral/nasal intubation or tracheostomy tube.

Figure 29 Ventilation Rate in 2017/18, by Classification



Data from 147 ICUs.

Appendix 1 – CCR Survey Methodology

Survey Instrument

The online survey was sent to 217 ICUs in Australia and New Zealand in October 2018 with the return of surveys accepted until late January 2019. Follow up of non-submitted surveys was by email and telephone.

Data Quality

The survey is reliant on self-reporting by staff members at the contributing ICUs. To assist with this process, supporting documents were provided to assist contributors in understanding key terms and to provide the framework for determining ICU levels. Where applicable, CCR endeavours to follow definitions listed in the National Health Data Dictionary.

Submitted data was checked and any identified issues or discrepancies, both within each survey and relating to answers provided in previous surveys, confirmed with the survey contact nominated by the ICUs. Not all questions were answered by all ICUs, and despite follow-up of missing data, questions remain unanswered for various reasons. To account for this, the number of contributing ICUs is indicated in each section below.

Data Analysis

The online survey tool enters data into a Microsoft SQL server database. Data extraction and analysis was undertaken with Microsoft SQL server and Microsoft Excel.

Presentation of Data

Data is presented in tables and various types of graphs. Data presented is for the 2017/18 financial year (1 July 2017 to 30 June 2018), unless otherwise stated. Box and whisker plots represent the range, interquartile range and median, unless specifically indicated otherwise. Effort has been taken to avoid identifying individual ICUs, see notes below each graph for details.

Data Items

Extensive data relating to the resources and activity of ICUs in Australia and New Zealand is collected by the CCR survey, however, to ensure only the most relevant information is presented, not all data items are presented in this report. The data not presented here includes Clinical Indicators and staffing models but is available upon request from ANZICS CORE. Please complete an information request form available here: https://www.anzics.com.au/data-access-and-publication-policy/

Comparison Groups

This report separates ICUs into two types of comparison groups; region and classification. The location of ICUs in Australia and New Zealand is separated into nine regions; eight states and territories in Australia, and New Zealand as one region. ICUs are classified as one of four hospital classifications; Tertiary, Metropolitan, Rural/Regional and Private. In the paediatric section - PICUs are separated from other Tertiary ICUs. Classification is determined by various factors, including geographical location and patient case mix. Effort is taken to align classifications across all ANZICS CORE registries.

Information on the level and type of ICU was also collected in the survey, but not used as a comparison for the purpose of this report.

ICU Beds

For the purposes of the CCR Survey, beds are categorised as general ICU, other ICU and High Dependency Unit (HDU). Coronary Care Unit (CCU) beds were collected and explicitly excluded.

Physical and Available Beds can be described in any category of bed, however ventilator beds can only be described in general ICU and other ICU categories. For the purpose of this report, beds are reported as physical and available, and not broken down by category.

ICU Activity

The CCR Survey collects data relating to Adult and Paediatric patient admissions to an ICU, including admissions, bed days, readmissions, admission source, discharge destination, patient ventilation and activity indicators. Definitions of these activities are detailed in the respective sections of this report.

Intensive Care Workforce

Data is collected on medical, nursing and allied health staff within ICUs and reported in the workforce section. Extensive data is collected profiling both medical and nursing staff, however for the purposes of this report details of staffing models have not been included but are available upon request from ANZICS CORE. Please complete an information request form available here: https://www.anzics.com.au/data-access-and-publication-policy/

Changes over Time

In addition to reporting on the 2017/18 financial year, this report makes comparisons against previous survey years. As different ICUs submitted surveys each year, the time series analysis includes only data from ICUs that consistently submitted a survey in all the years in question. This was done to prevent differences in the combination of ICUs masking any trends in changed resources of activity over time. The number of ICUs included in each time series analysis is indicated in each section.

Population

For analysis of data in relation to population, estimated population data at the end of June 2018 financial year was used. Data was obtained from the Australian Bureau of Statistics and Statistics New Zealand. Population was 24,988,234 for Australia and 4,885,300 for New Zealand.

Appendix 9 – Glossary

Available Bed	A bed with advanced life support capability that is fully staffed and funded.
Bed Days	A bed-day is a day during which a person occupies a bed in which the patient stays overnight in an ICU.
Declined Admissions	The CCR Survey collects two variables on declined admissions; declined elective surgery admissions due to inadequate ICU resources and declined unplanned admissions due to inadequate resources. Declined elective surgery admissions due to inadequate resources are calculated as a proportion of planned admissions to ICU and declined unplanned admissions due to inadequate resources as a proportion of unplanned admissions to ICU. The two data point are combined to calculate an overall declined admission rate as a proportion of total ICU admissions.
Exit Block	Delay in the discharge of a patient of 6 hours or more.
Full Time Equivalent	A unit that indicates the workload of an employed person (or student) in a way that makes workloads comparable across various contexts.
Intensivist	A medical practitioner who has been specifically trained in intensive care medicine. Intensive care specialists are formally certified in intensive care by completing the training requirements of the CICM.
Interquartile Range	The range between the first and third quartile (25%-75%) when values are listed in ascending order.
Invasive Ventilation	Mechanical ventilator support via oral/nasal intubation of tracheostomy tube.
Percentage Occupancy	Patient Bed Days divided by the total number of Available Beds multiplied by the number of days for the given period.
Median	The middle value when values are listed in ascending order.
Medical Emergency Team/Rapid response Team	Medical and nursing with advanced clinical and resuscitation skills who respond to at-risk patients in settings outside the ICU. Such patients present with specific criteria
Non-Invasive Ventilation	Ventilatory support such as CPAP/BiPAP, administered via facial or nasal mask or nasal cannulae.
Occupancy Rate	Calculated by the number of bed days divided by the number of available bed multiplied by 365 days
Planned Admission	A planned admission to ICU/HDU. Post-surgical/procedure admissions are considered planned admissions when the need for admission was anticipated pre-operatively or prior to induction of anaesthesia. For non-surgical admissions, a planned admission should be considered as one that could be postponed for 24 hours with no adverse effect.
Physical Bed	A single patient care location fully configured to ICU standards. It is an actual bed, not a bed space.
Undivided Admission	Admissions that have not been classed as unplanned (emergency) or planned, or ICU or HDU, but have been reported to CCR.
Unplanned Admission	An emergency admission to ICU/HDU for urgent care or treatment that could not be postponed without adverse effect. A postponed planned admission can subsequently become an unplanned or urgent admission.
Ventilator Bed	A physical ICU bed plus ventilator.
